Time to put things
into practice!

Scenario A

There is a new policy for Research Data Management and Open Science in your institution and your team asks you to lead its implementation for your faculty to better support researchers and students. It's amazing that you get the chance to make such changes, congratulations! But... where do you start?

Admins

1. Create a Blueprint with the information UNITO expects to receive from researchers and/or students.

1.1 Are there any services in UNITO to connect to?

2. Create a simple Template for datasets and another one for ethics.

2.1 Make conditional questions, create tables and use external resources.

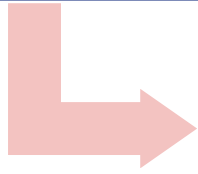

Scenario B

There is a new project in your institution that you will start working on with the team. Your supervisor hands you over the Description of Action (DoA) to familiarise yourself with the project objectives and deliverables, and asks you to lead the Data Management Planning activity. First of all, that's awesome, well done! Now, let's see how you can better prepare yourself to support your project team in writing the DMP.

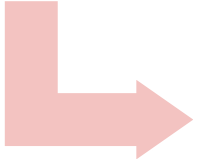

1. Download the DoA:
<https://riojournal.com/article/98457/>

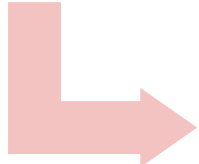

2. Questions:

2.1 The DoA is certainly a good starting point to write a DMP, but is it enough?

2.2 What are the activities that will generate or re-use data?

2.3 Who is responsible for this data?

3. Create the Plan that Admins prepared for you to see what might be missing.

Researchers
