EIFL Open Science bootcamp

# Training challenges

- Complexity of the topic
  - RDM, DMP, FAIR, Data publishing and licenses, Open Data
- Terminology
- Misconceptions (Open Data, data scooping)
- Good practice, but not always mandatory
- More work for researchers, “administrative burden”
- Infrastructure (in national language)
- Lack of incentives

# Research data management

Research data management (RDM) refers to the organization, storage, preservation, and sharing of data that was generated or collected and used in a research project.

Research Data Management = good research practice

Final goal of RDM is that data are:

- secured and preserved;
- easy to find, understand and reuse.

# Research data

Research data - information that has been collected, observed, generated or created to validate original research findings

- Depends on audience;
- Digital and non-digital data
  - Non-digital data --> physical samples, 3D digitization; include metadata;

*Question: What needs for data to be understandable and reusable, even after some longer period of time?*

Data needs metadata and other documentation (codebook, software code, lab notebooks, data quality assessments, etc.), and to be in sustainable formats.

Research data and metadata needs to  
be ready for both

humans & machines

# The need for RDM

Reasons why researchers need a good RDM practice:

- requirements: funder, institution, publisher
  - ex. [Horizon Europe](#), [Bill & Melinda Gates Foundation](#), [Wellcome Trust](#), etc.
- improve scientific communication and cooperation
  - increase citations
- transparency, reproducibility
- prevention of data loss
- reduce duplication of efforts
  - more ethical research

# Common RDM misconceptions

Common misconceptions regarding RDM:

- administrative burden
- data scooping, lack of control over data
  - RDM does not mean Open data
- fear of wrong data interpretation
- IPR issues, data privacy

In fact, all these issues can be solved with good RDM practice.

Tips: be prepared; have “data champion” with you; design a website (with Q&A); promote RDM use cases on workshops, website and/or social media

# Research data lifecycle

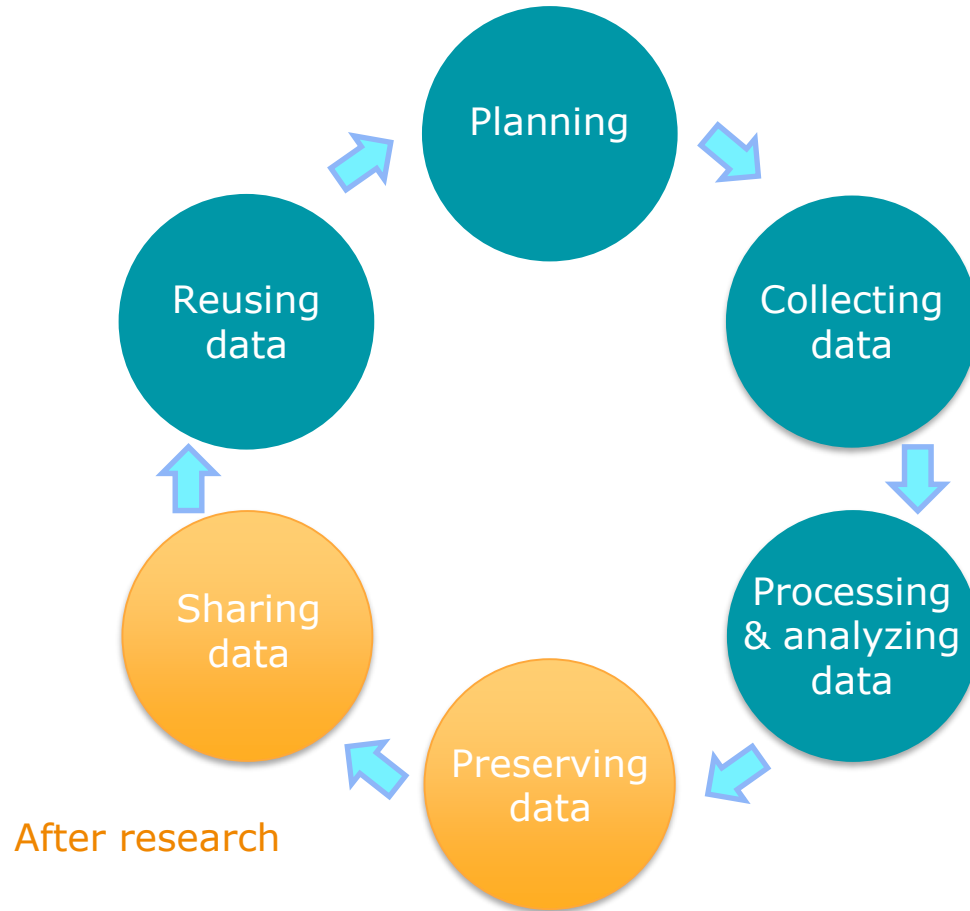

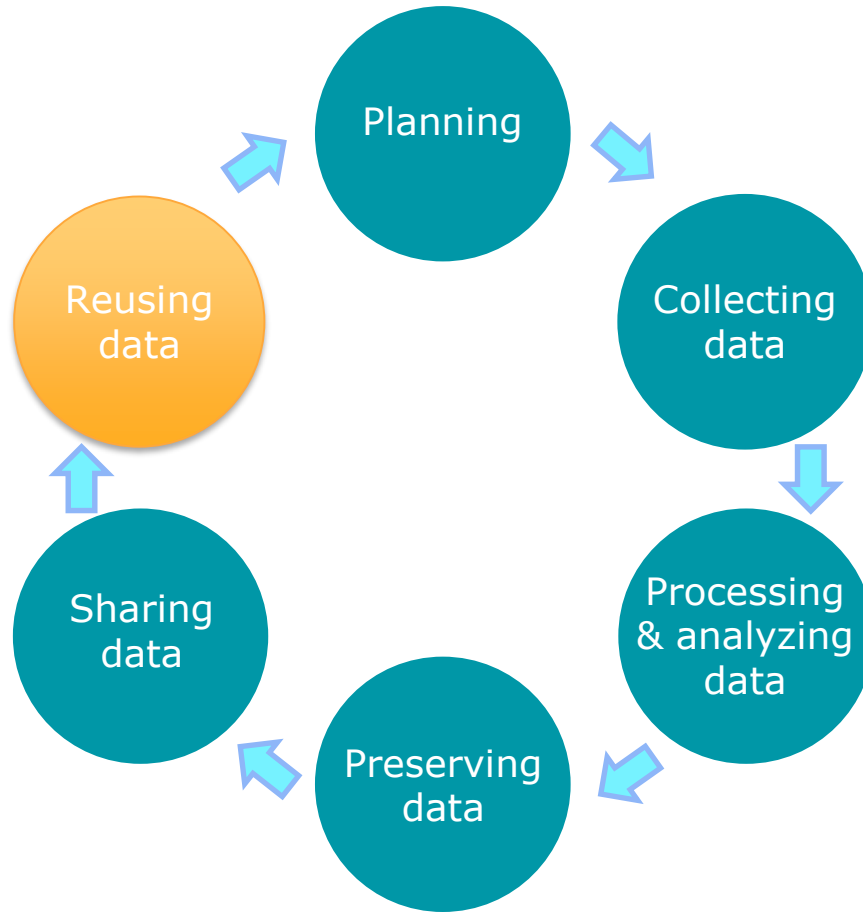

During research

# Data lifecycle: Planning phase

## Data Management Plan (DMP)

- Design research
- Policy compliance
- Identify existing data sources
- Data collection and processing
- Data security measures
- Data management cost
- Long-term preservation and sharing

# Data lifecycle: Collecting data phase

## Collecting and/or generating data

- Organizing data
  - file and folder naming
    - agree on terminology
    - separate words with \_ (underscore)
    - date format - ISO 8601: YYYYMMDD
  - folder structure
  - version control
    - include version number: v1, v2\_1, final

# Data lifecycle: Collecting data phase

- Metadata
  - standardized, structured, human- and machine-readable
  - resources: [RDMkit](#) (Elixir-Europe), [Metadata MOOC](#)
  - standards: [FAIRsharing](#), [RDA metadata directory](#)
  - tools: [Dublin Core generator](#), [ENA checklist](#), ...
- Documentation
  - ELN – electronic lab notebooks (*Jupyter Notebook*)
  - README file
    - <https://guides.lib.uci.edu/datamanagement/readme>
  - GitHub
    - can be used for version control
  - anything that can provide additional information on data

# Data lifecycle: Processing & analyzing data phase

Analysis and interpretation of data

- Anonymize sensitive data
  - [Amnesia](#) (OpenAIRE)
- Data cleaning, validation and quality checking
  - [OpenRefine](#)
- Describing and documenting
- Storing, organizing, version control

# Data lifecycle: Preserving data phase

Data needs to be safe and preserved during and after the research.

Preservation during the active phase:

- backup plan
  - 3-2-1 rule
  - recommend cloud storage

*backup and long-term preservation are NOT the same*

- access control
  - password protection
  - encryption

Image by [John](#) from [Wikimedia Commons](#) under [CC-BY](#) license

# Data lifecycle: Preserving data phase

Long-term preservation :

- Data selection and appraisal
- Migrating to open and sustainable formats
  - [DANS list of preferred formats](#)
- Archive both data and documentation

# Data lifecycle: Sharing data phase

- Choose discipline specific or generic data repository,
  - rather than publishing data as supplementary in journal articles
  - [re3data.org](https://re3data.org)
  - certified repositories: CoreTrustSeal, ISO 16363, Nestor Seal;
  - long standing and solid user base – Zenodo
- Provide metadata and documentation
- Choose license and access control
  - look for funder requirements
  - licenses for data and for software
- Data paper

# Training tips

- Avoid teaching everything about RDM in one event.
  - break it down in smaller pieces (DMP, FAIR, data publishing);
- have in mind final goals of RDM: data is secured and preserved, easy to find, understand and reuse;
- as soon as possible deal with misconceptions, especially about unauthorised data usage and open data;
- Data champions. Use the researchers that had previous experience with data management.
- Explain terminology used in RDM;
- Present use cases;
- Have recommended materials with you. DIY (in national language);
- stay informed about the policies and requirements;
- stay informed on new developments.
